AUTOMATIC ONE BAR FRAME PRESS

SBU/A

Very solid structure, welded and worked with high precision machines, the frame press model SBU/M is made by a vertical beam that evenly distributes the pressure on the frame by using two pistons. The fixed squares can be positioned manually, while the movable squares and the superior beam are moved by vertical pistons. Every operation is controlled by a push button which allows the operator to check easily any working phase of the frame press. The frame press is completed with a pressure gauge that reads the pressure and handwheels which regulate the pressure of the lateral and vertical pistons and it is controlled by a PLC. On request, we can also add some optionals for particular works (rack bar suitable for shutters making) and some accessories which enable a better work.
