

## module45 – the cutting-edge option for precise bevel cuts

Why is nearly every pocket-knife today a multi-tool? Because all-rounders save a lot of individual tools, are extremely efficient in use and unbelievably practical – just like the new module45 from HOLZMA. This technological innovation allows you to complete all your bevel cuts directly on your HOLZMA saw. It is quick, easy to use and infinitely adjustable for angles ranging from 1 to 45 degrees.

HOLZMA module45

# NEW! Rip cuts, cross cuts and bevel cuts all on one saw

## THE innovation for the trade sector

Whether for fair booth construction or shop fitting, for furniture manufacturing, classical carpentry work or interior fittings, bevel cuts are part of everyday life in the trade sector. After cutting has been completed on a panel saw saw, bevel cuts are usually dealt with on a separate sliding table saw. This costs money, takes up space and ties up resources in production, as well as increasing the amount of handling required. Another disadvantage is that material can easily be damaged when it is transported from one machine to another.

The innovation: module45 will make all these disadvantages things of the past because this unit allows you to complete bevel cuts directly on the saw. This option is now available for many HOLZMA saws, for retrofit too.

### The technology

- module45 consists of a stationary saw carriage with a swiveling saw blade that can be seamlessly adjusted to angles of 0 to 45 degrees.
- Looking at it from the front, the unit is integrated in the air cushion table on the far left.
- The table plate can be opened, allowing easy access to the saw carriage for changing saw blades.
- Other features include dedicated systems for contact pressure and dust extraction, plus a fold-down right-angled fence for maximum handling flexibility at the front of the saw.

### Simple and reliable

module45 receives its production data from HOLZMA's optimization software Cut Rite, or directly from CADmatic. This makes producing bevel cuts significantly easier and more reliable than on a circular saw.

### For nearly all HOLZMA saws

module45 is available for the HPP 130, for nearly all the saws of the HOLZMA 2, 3 and 4 series, and also for the HPP 300 multiTec. It is suitable for parts with thicknesses ranging from 10 mm to 25 mm and up to 1 000 mm wide. With a maximum travel path of 5 600 mm, parts can be up to 5 300 mm long.

### The benefits of module45

- Can be retrofitted at any time
- Low investment costs, high benefits
- You will no longer need a sliding table saw for bevel cuts
- Higher energy efficiency as two machines in one
- Easy one-man operation
- Less waste and higher quality thanks to less transport damage as the material remains on the one machine
- Greater ergonomic benefits and higher reliability than a circular saw
- Unbeatable cost-benefit ratio
